# PV Circulator® Solution

Bring PV processing in-house. Recover more material value.

## One platform. Multiple PV module conditions.

PV Circulator® is a modular, dry physical recycling solution designed for intact, broken and bifacial photovoltaic modules. The process separates key material streams without chemicals, thermal treatment or process water.

| PROCESS | RECOVER | MONETIZE |
|---|---|---|
| Intact / broken / bifacial modules | Glass / aluminum / copper / polymers / cell materials | Processing revenue + recovered material value |

## Why layer-by-layer separation matters

Conventional processing can recover commodity metals while leaving a large mixed or low-value fraction. PV Circulator is designed to preserve material separation quality, reduce the residual fraction requiring secondary treatment, and create additional downstream options.

## Operating profile

| | |
|---|---|
| **Nominal throughput** | 60 panels/hour |
| **Energy** | < 1 kWh/panel |
| **Process** | Room-temperature dry physical separation |
| **Chemicals / heat / water** | None in the primary separation process |
| **Deployment** | Modular line; suitable for recycler integration |

## Beyond equipment

PV Circonomy supports recyclers with business-case modeling, material recovery strategy, downstream/offtake solutions, cell-material purification pathways and digital traceability options. The goal is to help an existing recycling operation add PV processing capability - not simply add another machine.

Illustrative information only. Actual economics depend on module mix, recovery performance, local labor and facility costs, commodity pricing, disposal classification, permitting, logistics and operating conditions.
